PROFESSIONAL SUMMARY

Technical founder and forward-deployed engineer with a track record of embedding directly with customers to ship complex technical systems in production. Built a full-stack LLM-powered application using the OpenAI API; served as the primary on-site technical representative for a satellite hardware company delivering flight systems to prime government contractors. Proven ability to operate with high agency under ambiguity, build trust with technical stakeholders, and drive real-world adoption of advanced technology at the customer site.

EXPERIENCE

Founding Engineer | Cohost | Nov 2023 – Feb 2025

AI-powered iOS assistant

- Sole engineer across the full stack of a production GenAI application: Python/Django backend, Swift/SwiftUI iOS client, and deep integration with the OpenAI API.
- Designed and iterated advanced prompting strategies and conversation thread state management to produce consistent, context-aware model behavior in a novel promptless product interaction model.
- Architected a privacy-first backend for always-on audio ingestion without persistent user data storage; shipped to real users via TestFlight and iterated based on live usage feedback.

Customer-Facing Test Engineer | Skyloom Global Corp. | Jan 2022 – Apr 2024

Laser communication terminals for satellite applications

- Functioned as Skyloom's primary forward-deployed technical representative: embedded on-site with prime government contractors, translated customer requirements into engineering deliverables, and ran live technical demonstrations that directly unlocked milestone contract payments.
- Traveled solo to Japan to conduct a multi-customer technical engagement. Presented to and built relationships with three key partners independently.
- Hand-delivered Skyloom's first four laser communication terminals to customers, providing on-site integration support, troubleshooting, and training to ensure successful deployment.
- Built automated Python test infrastructure and owned the V&V pipeline for the Acquisition, Pointing, and Tracking subsystem, bridging the gap between internal engineering teams and external customer requirements.

Founding Engineer | EyeZense (Stealth Startup) | Oct 2024 – Jan 2026

AI-powered robotics for critical infrastructure security

- Built IoT and AI robotics systems end-to-end from blank page: hardware assembly, C++/Python firmware, ROS 2 middleware, and cloud integration.
- Served as primary technical face of the company during fundraising; built and executed prototypes and live demonstrations that secured a \$15M seed round.

Software Engineer (Open Source) | eReader Text Grabber | 2025

- Built and open-sourced a Python tool that orchestrates UI automation and OCR to extract eReader content to text files (for LLM ingestion). Demonstrated initiative and fluency with modern AI-augmented developer workflows.

EDUCATION

M.S., Mechanical Engineering | University of California, Berkeley | 2020–2021

GEM Fellow

B.S., Mechanical Engineering | University of Southern California | 2012–2016

TECHNICAL SKILLS

- **GenAI & LLMs:** OpenAI API, advanced prompt engineering, context/state management, agent design patterns, LLM-assisted development
- **Languages:** Python, Swift, C++, MATLAB, Bash/shell scripting
- **Platforms & Tools:** Django, SwiftUI, ROS 2, Git/GitHub, Ubuntu Linux, TestFlight
- **Customer & Deployment:** Forward deployment, on-site technical engagements, production system delivery, cross-functional stakeholder communication, international travel
